Abstract

Background and aim: Information about spiritual needs and quality of life (QoL) is limited in Iranian cancer patients. This study was conducted to determine the relationship between spiritual needs and QoL among cancer patients in Iran.

Methods: This correlational study included a convenience sample of 150 eligible cancer patients who were hospitalized in the oncology wards and outpatient clinics. Using two questionnaires; the spiritual needs survey and the European Organization for Research and Treatment of Cancer QoL Questionnaire-C30 data were collected. The data were analyzed by SPSS software version 19.

Results: Our findings showed that the total mean score of spiritual needs was (64.32 ± 22.22). Among the categories, the lowest score belonged to "morality and ethics" component (2.18 ± 1.64), and the highest score belonged to "positivity/gratitude/hope/peace" component (15.95 ± 5.47). The mean score of QoL was (79.28 ± 19.20). Among the categories, the lowest score belonged to "global health status" component (8.44 ± 3.64), and the highest score belonged to "functional" component (36.57 ± 10.20).

Abstract

Purpose: Spiritual needs are important for many patients with life-limiting illnesses. Knowledge of spiritual needs is a first step to their fulfillment; however, such knowledge is lacking for patients with cancer in mainland China. This study evaluated spiritual needs among patients with cancer in China and analyzed their associations with demographic and clinical characteristics.

Methods: A descriptive, cross-sectional study was performed. A general information questionnaire and a Chinese version of the Spiritual Needs Scale were used to collect information about patients with cancer. A total of 200 participants were recruited, and 182 completed the survey.

Results: The overall average spiritual needs score was 3.15. Of five dimensions investigated, the highest and lowest scores were for "hope and peace" (mean = 3.31) and "relationship with transcendence" (mean = 2.96). Of specific needs, "to be accepted," "to take responsibility for my life," and "to alleviate my suffering" (means = 3.26, 3.20) were ranked as most important by participants.

Abstract

Background: Resilience has been linked to psychological adaptation to many challenging life events.

Objective: The goal was to examine 3 coping strategies--expressing positive emotions, positive reframing of the cancer experience, and cultivating a sense of peace and meaning in life--as potential mechanisms by which resilience translates to quality of life among women recently diagnosed with gynecological cancer.

Methods: This cross-sectional study utilized baseline data from women diagnosed with gynecological cancer participating in an ongoing randomized clinical trial (n = 281; mean age, 55 years; 80% were
