A reduction in WM capacity may adversely impact the quality of life and elevate the risk of developing neurodegenerative diseases in the future. Presently, there is no established medication that can effectively prevent cognitive decline.</p> <p>Objective: Over the past decade, numerous research articles have investigated the impact of exercise on cognitive function, particularly focusing on WM in adults.</p> <p>Methods: Critical reading of several literature that includes a focus on discussion of the effect of exercise on WM. Scientific articles search is conducted using online databases such as PubMed and Google Scholar.</p> <p>Results: Exercise improve WM through neuroplasticity. Post exercise improvement on WM can be seen in every ages studied.</p>
